5. **\*\*Manually crop the black edges off of the frame and the logo.\*\*** When cropping a photograph, make sure that you don't crop off the edges of the photo or the edges of the frame, as these parts will be lost when you print the photo. 6.

**\*\*Duplicate the Background layer twice and name one layer Background and one layer Background Out.\*\*** A Background layer acts as your background. It's usually very simple to create a basic background in Photoshop by using the Lock tool and setting it to a solid color. However, if you want to create any special types of backgrounds, such as a photo frame, an

---

image with a texture, or even a background photo or picture, you can create a more complex background using multiple layers. The Background Out layer serves as the background for the rest of your work. So, when you edit the background of your image using Gradients or Patterns, the edits will be applied to the Background and Background Out layers. 7. \*\*Duplicate the Background layer and rename the duplicated layer to a name such as Pattern Background.\*\* A Pattern layer is more complex than the simple solid color layer used in Step 6. They allow you to place an image as a background, and then you can alter that background to control the final appearance of the image. Therefore,

---

creating a complex layer like a Pattern layer or a Composite layer is really a question of how much time you have to play with your photo. The more complex you make a layer, the more time it takes to retouch. If you want to play with the layer at all, it may be easier to just create a simple solid color layer and edit that color later. 8. **\*\*Adjust the layer's Opacity setting.\*\*** You usually want to avoid setting the Opacity setting to 100 percent so that you can see what's underneath the layer without having the background be completely transparent. Try setting the Opacity setting to 50 percent. If you change it to 100 percent, you won't see a chance to tweak it later. 9. **\*\*Merge the Background layer and the**

---

Pattern Background layer together to create a new layer group that contains both layers.\*\* When the two layers are merged, the image on the Pattern Background layer doesn't change, but the image on the Background layer changes. When you place a Pattern on a background layer, any changes to the background will affect the image in the

Q: SignalR - Multiple Clients, Database Security I'm starting to use SignalR to create a Web App with ASP.NET MVC and I'm having some trouble. I want to create a connection between the server and each client and use the same database for each client. I've read this blog entry here and that seems like what I need. However, I'm not sure if it's possible to implement this if I have multiple clients. As far as I know, each connection is independent and does not send information to other connections. How

---

would I connect the server to multiple clients using SignalR? Thanks! A: To answer your question directly: It is definitely possible to connect to multiple clients at once, it's a common requirement for client-server frameworks. Your client code sends requests to the SignalR server and expects a response. As long as the client code is properly stateful and doesn't perform concurrent operations across connections, it's not a problem (i.e. the server is not going to block the client, and vice versa, and both are going to be communicating over a persistent connection). To get a bit more background, SignalR is a client-server signalling protocol built on top of a persistent TCP/IP connection, hence the

---

need to send/receive requests and responses over the same connection. You're absolutely right that client connections are completely isolated from each other. Characterization of a spontaneous, lethal white-rot basidiomycete with unusual activity against the saprotrophic bacterium, *Bacillus subtilis*. The term white-rot fungi has become a useful paradigm for a class of fungal species in the belief that they loosen lignin-rich host cell walls in order to survive in soils and in decaying plant material. Many white-rot fungi of the polyporoid class have been shown to be highly efficient at degrading lignin, but many of them have not been studied in detail at the enzymatic level. In this study,

we report the isolation of a new white-rot polypore *Basidomyces rufifaciens* NRRL YB-2033 from gilled branches of spruce (*Picea* sp.) in the Rocky Mountain National Park. The isolate grew slowly at temperatures  $>25^{\circ}\text{C}$ , but was able to utilize a wide variety of carbon sources. It produced a single type of extracellular laccase, which is a white-
